3 Introduction

The following document details the System Design for project Sayyara. Sayyara is a progressive web application (PWA) which will act as a single platform for independent auto repair shops and vehicle owners. This platform will allow independent auto repair shops and vehicle owners to interact in a more efficient and effective manner.

Complementary documents include the Module Interface Specifications and Module Guide. The full documentation and implementation can be found at <https://github.com/arkinmodi/project-sayyara/>.

4 Purpose

The purpose of this document is to display the component decomposition of the system and provide the user interface designs of the software being built. The implementation of the software will be based off of the designs within this document. The MIS <https://github.com/arkinmodi/project-sayyara/blob/main/docs/Design/SoftDetailedDes/MIS.pdf> and MG <https://github.com/arkinmodi/project-sayyara/blob/main/docs/Design/SoftArchitecture/MG.pdf> are also created to give details to the software architecture and detailed component breakdowns for the project.

5 Scope

The system is designed to connect vehicle owners and independent shop owners, providing users with the ability to communicate with one another, and respectively view and manage the interactions and processes involved in a typical auto repair and maintenance service experience. All functionality of the system has been defined in the SRS <https://github.com/arkinmodi/project-sayyara/blob/main/docs/SRS/SRS.pdf> and everything not included in the SRS is not part of the scope.

The system includes a PWA and the relevant database to store information relevant to the application.

5.1 Context Diagram

Below is a context diagram detailing the boundary between the system and the environment around it.

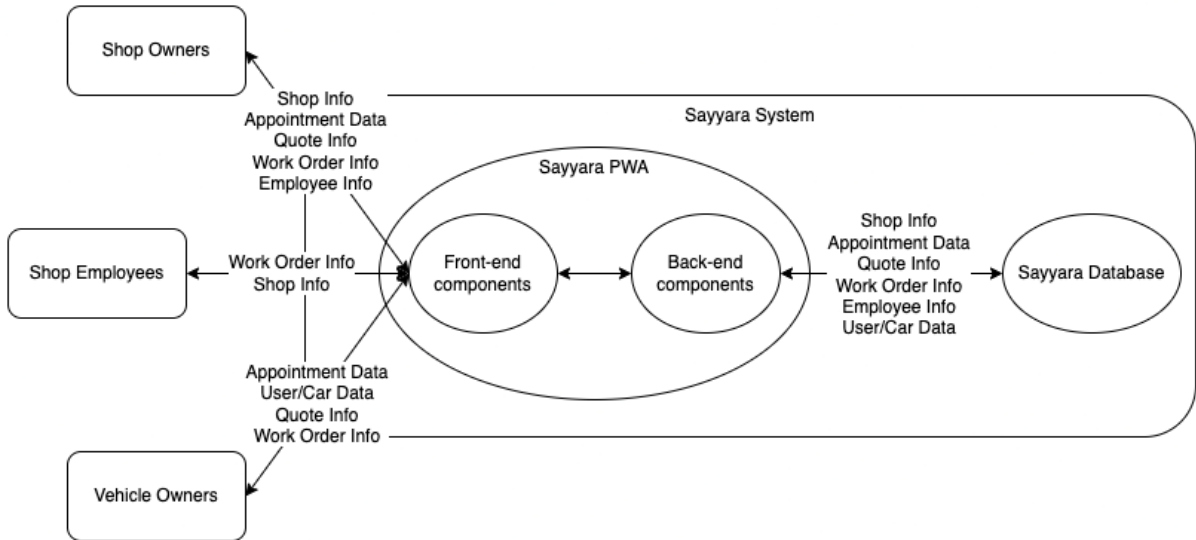

Figure 1: Context Diagram

6 Project Overview

6.1 Normal Behaviour

Sayyara is an event-driven application which handles inputs from the intended users including: vehicle owners, and independent auto repair shop owners and employees. The application will accept various inputs through a variety of input forms and controls. Under normal behaviour where valid inputs are entered and valid events are triggered, the application will: update the appropriate local and global application states, trigger the corresponding side-effects, and/or update the database accordingly.

Vehicle owners can search for auto repair shops and services; request quotes for service; book, view, and manage service appointments and work orders. On the application, auto repair shop owners will be able to manage a list of employees; manage a list of service types and corresponding service appointment availabilities; manage store information such as location, hours of operation, and contact information. Auto repair shop owners and employees will be able to view and manage quotes, service appointments, and work orders.

6.2 Undesired Event Handling

Undesired events will be handled both client-side and server-side.

On the client-side, if an unexpected event arises or the application enters a bad state, the application will reset to a safe state. For example, if a user attempts to access a route that they are not authorized to access, they will be either redirected to an appropriate route, prompted to login, or an error page will be displayed with instructions to return to the home page. Input forms will also include input validation to ensure only properly formed data is handled. If the user attempts to input invalid data, the form field will reset and form submission will be blocked. The user will be prompted to enter a valid input value in the form field. Similarly, various user actions and inputs that may pose

cause that the application to enter an undesirable state will be validated before updating the application state.

On the server-side, each API will return a response with the appropriate error status code and message. Subsequently, the client will have logic to gracefully handle unsuccessful responses and status codes, preventing the system from entering an undesirable state. Inputs will also be validated on the server-side by parsing the input data using defined schemas. This will ensure data integrity and prevents the undesirable data from entering the workflows or database.

6.3 Component Diagram

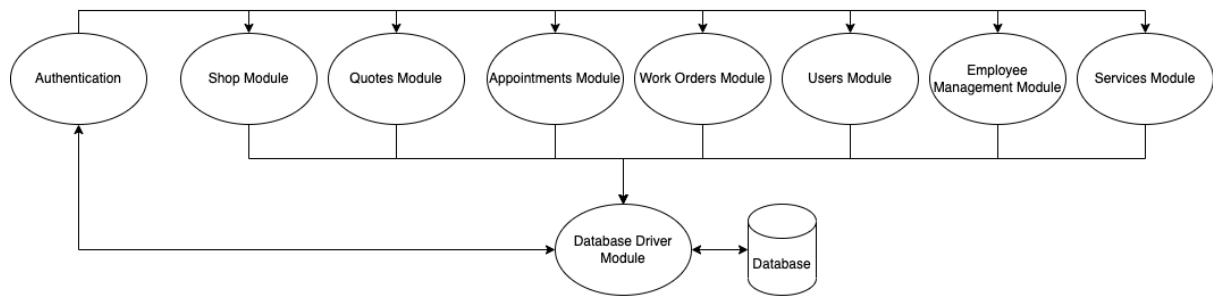

Figure 2: Component Diagram

6.4 Connection Between Requirements and Design

The following table shows the connections between the requirements stated in the SRS <https://github.com/arkinmodi/project-sayyara/blob/main/docs/SRS/SRS.pdf> and our design decisions to implement the requirements. The requirements in the table will refer to the requirement number as stated in the SRS.

Table 2: Connection Between Requirements and Design

Requirement	Design Decision
BE4	A calendar dropdown is used to allow the user to view appointment dates
BE8, BE20	The quotes, appointments are in a tab view for easy visibility
BE25	Employees are listed in a list view
BE32	Shops are listed in a list view, with tags showing information relevant to the filters (such as services provided and parts used)
LF1	Each screen has a desktop and mobile view so that it can adjust cleanly based on the user's screen size
SR1, SR2	Separate views are created for each type of user, so that they have access to only information that the specific user needs. Each account is created with a unique user type, so that they can only access the correct view
LR1	Images and assets used are either created by the team or provided by the stakeholder

8.10 Vehicle Owner Create Appointment

The diagram illustrates the 'Vehicle Owner Create Appointment' process on a desktop interface. It consists of three main panels:

- Select a Service:** A form titled 'Shop Name' with a 'Select a Service' dropdown menu. The menu options are: Oil Change, Tire Rotation, Filters, Brakes, General Maintenance, and Other. Below the menu is a button labeled 'Schedule Service / Proceed to Quote'. A red note states: '* Button text will vary depending on type of service (i.e., canned or non-canned) selected'.
- Create Appointment:** A form titled 'Shop Name' with fields for 'Vehicle Year' (2015), 'Vehicle Make' (Honda), and 'Vehicle Model' (Civic). It includes a 'Service' dropdown (Oil Change), an 'Appointment Date' field (highlighted with a red box and a calendar icon), and an 'Estimated Time' field (1 hour). Below these are fields for 'Estimated Cost' (\$50) and a 'Description of service, same as the description from quote invitation'. A 'Schedule Service' button is at the bottom.
- Available Timeslots:** A panel titled 'Available Timeslots' showing 'Job Type: Tire Rotation' and 'Duration: 1 hour'. It displays a grid of time slots: 9:00 am, 10:00 am, 11:00 am, 12:00 pm, 1:00 pm, 2:00 pm, 3:00 pm, and 4:00 pm. The 3:00 pm slot is highlighted with a red box.

Flow arrows indicate the process: 'On Click' from the 'Appointment Date' field leads to a calendar view. From the calendar, 'On Click' leads to the 'Select Date' button, which then leads to the 'Available Timeslots' panel. A red arrow labeled 'On Click, send back to initial form' points from the 'Available Timeslots' panel back to the 'Create Appointment' form.

Figure 32: Vehicle Owner Create Appointment (Desktop)

8.11 Shop Owner/Employee Dashboard

8.11.1 Quotes Requests

The screenshot shows the 'Shop Owner/Employee Dashboard' with a focus on 'Quotes Requests'. The dashboard has a top navigation bar with 'LOGO', 'Service Requests', 'Manage Shop', 'Profile', and 'Logout'. Below this is a sub-navigation bar with 'Quotes' and 'Services Requests'. The main content area is titled 'Conversations' and features a search bar labeled 'Search conversations'. On the left, there is a list of conversations, each with a shop icon, the name 'Shop Name', the address '123 Address St.', and the creation time 'Create XX/XX/XX XX:XX PM'. On the right, there is a detailed view of a conversation with a shop icon and the name 'Shop Name'. Below this, there are several blue and green rectangular blocks representing messages or actions. At the bottom right, there is a button labeled 'Invite to Schedule' and a small 'Aa' text icon.

Module Name	Development Timeline	Developer(s)
Database Driver Module	Dec. 1, 2022 — Jan. 31, 2023	Arkin Modi, Joy Xiao, Leon So, Timothy Choy
Users Module	Dec. 1, 2022 — Dec. 15, 2022	Arkin Modi, Leon So
Employee Management Module	Dec. 15, 2022 — Dec. 22, 2022	Joy Xiao, Leon So
Shop Module	Dec. 15, 2022 — Dec. 22, 2022	Leon So, Timothy Choy
Quotes Module	Jan. 1, 2023 — Jan. 8, 2023	Arkin Modi, Timothy Choy
Services Module	Jan. 1, 2023 — Jan. 8, 2023	Arkin Modi, Joy Xiao
Appointments Module	Jan. 15, 2023 — Jan. 22, 2023	Arkin Modi, Joy Xiao, Timothy Choy
Work Orders Module	Jan. 15, 2023 — Jan. 24, 2023	Arkin Modi

12.2 Module Testing

The testing of the modules shall take place over the months of December 2022 and January 2023. The tests conducted shall primarily consist of manual testing and have the primary goal of certifying confidence for the Revision 0 Demonstration. This testing will not include everything described in the System Verification and Validation Plan. Generally, testing will take place for the week after development is scheduled to finish. Specific dates, and responsibilities are described in Table 4.

Table 4: Module Testing Timeline

Module Name	Testing Timeline	Developer(s)
Database Driver Module	Dec. 1, 2022 — Jan. 31, 2023	Arkin Modi, Joy Xiao, Leon So, Timothy Choy
Users Module	Dec. 15, 2022 — Dec. 22, 2022	Arkin Modi, Leon So
Employee Management Module	Dec. 22, 2022 — Dec. 29, 2022	Joy Xiao, Leon So
Shop Module	Dec. 22, 2022 — Dec. 29, 2022	Leon So, Timothy Choy
Quotes Module	Jan. 8, 2023 — Jan. 15, 2023	Arkin Modi, Timothy Choy
Services Module	Jan. 8, 2023 — Jan. 15, 2023	Arkin Modi, Joy Xiao
Appointments Module	Jan. 22, 2023 — Jan. 29, 2023	Arkin Modi, Joy Xiao, Timothy Choy
Work Orders Module	Jan. 24, 2023 — Jan. 31, 2023	Arkin Modi

13 Appendix

13.1 Reflection

The information in this section will be used to evaluate the team members on the graduate attribute of Problem Analysis and Design. Please answer the following questions:

1. What are the limitations of your solution? Put another way, given unlimited resources, what could you do to make the project better? (LO_ProbSolutions)

One of the main limitations on the resources available is the time allotted for this project. This has limited the number of features which we could support for this project.

To improve the project, we would propose adding the following features:

- Supporting multiple vehicles per customer
- Ability to specify employee skill sets and assign employees to service appointment bookings accordingly
- Adding email notification functionality
- Adding a profile page for employees and customers
- Add analytics dashboards for shop employees and owners
- Ability to delete and remove accounts
- Ability to sign up for employees to sign up to multiple shops
- Ability for shops to view and manage existing customers
- Add a parts entity and inventory management system
- Add a vehicle inspect checklist

In addition, there are some financial constraints on resources made available for the project. If we had unlimited financial resources, we would make the following improvements:

- Add a long-lived server to support and manage features that can benefit from being stateful
- Add an email server to support email communication and notifications

2. Give a brief overview of other design solutions you considered. What are the benefits and tradeoffs of those other designs compared with the chosen design? From all the potential options, why did you select documented design? (LO_Explores)

Our supervisor provided us with existing mockups for a UI, however, our team took initiative to completely refactor and redesign the application to be more user-friendly. With this, we simplified workflows for the user, to make the user experience more efficient and tailored to fulfill the desired functionality. We also gathered feedback from the project supervisor, and incorporated such feedback into the designs.

For the navigation bar, we considered two alternatives for the positioning of the navigation bar. We considered a top and bottom navigation bar for mobile devices.

We decided on a top navigation bar, as many of the pages show lots of information and often require scrolling. A top navigation bar is less intrusive when it comes to interfering with scrolling on mobile devices. A top navigation is also more visible and noticeable as the user interacts with the application on their phone.
